
Reference Models

Overview

- What functionality should we implement at which layer?
 - This is key design question
 - Reference models provide frameworks that guide us.

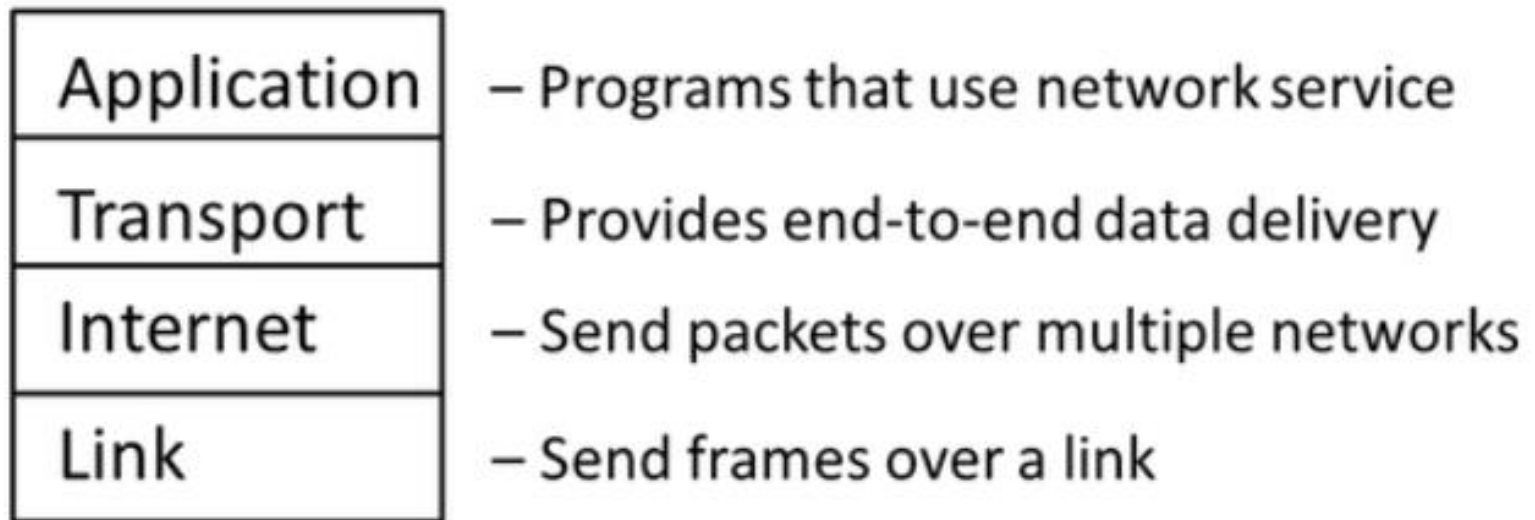

OSI “7 layer” Reference Model

- A principled, international standard, to connect systems
- Influential, but not used in practice.

7	Application	– Provides functions needed by users
6	Presentation	– Converts different representations
5	Session	– Manages task dialogs
4	Transport	– Provides end-to-end delivery
3	Network	– Sends packets over multiple links
2	Data link	– Sends frames of information
1	Physical	– Sends bits as signals

Internet Reference Model

- A four layer model based on experience; omits some OSI layers and uses IP as the network layer

Internet Reference Model (2)

- With examples of common protocols in each layer

Internet Reference Model (3)

- IP is the “narrow waist” of the internet
- Supports many different links below and apps above

Standard Bodies

- Where all the protocols come from!
- Focus is on interoperability

Body	Area	Examples
ITU	Telecom	G.992, ADSL H.264, MPEG4
IEEE	Communications	802.3, Ethernet 802.11, WiFi
IETF	Internet	RFC 2616, HTTP/1.1 RFC 1034/1035, DNS
W3C	Web	HTML5 standard CSS standard

Layer-based Names

- For units of data:

Layer	Unit of Data
Application	Message
Transport	Segment
Network	Packet
Link	Frame
Physical	Bit

Layer-based Names (2)

- For devices in the network:

Layer-based Names (2)

- For devices in the network:

Proxy or
middlebox
or gateway

But they all
look like this!

A Note About Layers

- They are guidelines, not strict
 - May have multiple protocols working together in one layer
 - Maybe difficult to assign a specific protocol to a layer
